#72020406 AI 2015 TRAILER CRADLES

Note that there is a forward and aft cradle. Your Adventure Island is widest at the middle and tappers at the bow. The forward crade tapers forward to fit the hull.

The forward cradle is form fitted to the hull at approx the drive well. Find the best point for fit. The aft cradle should be mounted to support the hull 67" aft of the forward cradle.

We don’t include mounting hardware since each trailer, rack system or storage arrangment differ and require differnt sized hardware. Slit the carpet at the mounting points to pass fastening hardware though.

When tying your Island down for transport, it is recommended that the main hull and amas be tied to the trailer separately. Tying the main hull and amas together (line across the load) will pull the main hull and amas against each other. In addition, release any shock cords used to hold the amas against the main hull. Amas held tightly against the main hull can cause damage to the hull surfaces as they rub together. Padding may be placed between hull and amas to protect the surfaces if needed.
